Rate methodology and billing granularity

Billable seconds are the duration rounded up to a whole multiple of the SKU granularity in the Billing granularity table; excluded attempts bill zero seconds.

Rate. For the instance class and region of the revision, take rate_card.xlsx rows recorded at or before the cutoff; among rows with the same effective_from the later recorded_at wins; the applicable row is the one with the greatest effective_from not after the corrected start. rate_card_final.xlsx is not a rate source; its Spot credits sheet is the only source of spot credits.

Cost. cost_micro = billable_seconds x micro_per_min x class multiplier / (60 x 1000), then x (1000 - spot credit) / 1000 for spot SKUs, then x reserved permille / 1000 when the runner has a reservation for the UTC calendar date of the corrected start. The product is kept exact and rounded once, half to even.

Clock zones. Wall times written in a zone use its offset at that instant: EU+1 is UTC+2 until 2025-10-26T01:00:00Z and UTC+1 after; US-5 is UTC-4 until 2025-11-02T06:00:00Z and UTC-5 after; US-6 is UTC-5 until 2025-11-02T07:00:00Z and UTC-6 after; AU+10 is UTC+10 until 2025-10-04T16:00:00Z and UTC+11 after; IN+5:30 is UTC+5:30; BR-3 is UTC-3. A wall time that occurs twice is the earlier instant unless it carries the suffix +fold, which marks the later instant.
