KESTREL POINT CONTAINER TERMINAL
BERTH OPERATIONS MEMORANDUM
shift KP-2042-S23   reference QCR-829677

SECTION 1 CONTROL VALUES ISSUED HERE

These three values are issued here and are carried in no other paper of this shift. The first two govern the quay ration; the third governs the dependency stage. The fourth value the quay ration needs, the damping fraction, is issued by the capacity workbook.

ration_pass_budget	5
ration_minimum_step	3 crane minutes
dependency_protection_depth	2

The pass budget is a count of passes, not a convergence test. The ration stops when the budget is spent whether or not the shares have settled, and the shares as they stand at that point are the shares that get published.

The minimum step is the smallest move a share may make in one pass. A share whose damped move rounds to nothing still moves by the minimum step toward its target, so a share that has not reached its target never sits still while passes remain.

SECTION 2 REHANDLE SURCHARGE LADDER

tier_depth	surcharge_cents
1	0
2	450
3	900
4	1600

A tier depth beyond the last rung of the ladder carries the surcharge of the last rung. A tier depth of one carries no surcharge.

SECTION 3 QUAY GANG ROSTER

The gang roster is the minute allowance the quay can actually crew in each slot. The berth window register declares what the berth asked for. The pool a berth rations in a slot is the smaller of the two.

SECTION 4 STANDING NOTES

Reserved capacity is withheld capacity. A block may show free slots
and still refuse a placement, because the reservation standing over
that block for that slot is settled before free capacity is counted.
