== Metric definitions
All metrics are computed exactly (rational arithmetic) over eligible items and rounded only when reported: to 6 decimals, half to even.
arith: correct when the answer, rounded half-even to 2 decimals, is within the item tolerance: exact means equal at 2 decimals, abs means |answer - gold| <= 0.01, rel means |answer - gold| <= |gold| / 100. N/A is an abstention and wrong. Primary metric: accuracy.
code: a sample passes when passed equals the problem's test count. With c passing samples of n = 10, pass@k = 1 - C(n - c, k) / C(n, k) per problem, averaged over problems; report pass@1 and pass@5. Primary metric: pass@1.
intent: predicted raw labels resolve through label_aliases.json under the job's taxonomy version; certified values use taxonomy v2 class names. Macro F1 averages per-class F1 = 2TP / (2TP + FP + FN) over the classes that occur as gold or prediction among eligible items.
safety: AUROC of the score against gold (1 = unsafe), with tied scores counted one half (Mann-Whitney).
mcq: accuracy of the chosen option. Expected calibration error uses 10 equal-mass bins: sort items by confidence ascending, ties by item id; bin sizes are N // 10, and the first N mod 10 bins get one more item; ECE = sum over bins of (bin size / N) * |bin accuracy - bin mean confidence|.
pref: for each item the two orderings are judged; a judgment is a win only when both orderings prefer the candidate, a loss only when both prefer the baseline, and a tie otherwise. win rate = (wins + ties / 2) / items.
longctx: correct when the normalised answer equals the normalised gold (NFC, case-folded, whitespace collapsed, surrounding punctuation . , ; : ! ? " ' removed) and the prompt token count for the model's tokenizer is at most the model's context window; longer prompts are wrong.
multiling: graders g2 and g3 normalise like longctx; g3 also removes combining marks. Per-language accuracy uses the language of the item's prompt locale; languages with fewer than lang_min_support eligible items (slice definitions) are left out; the suite metric is the mean over the remaining languages.
Normalised score per suite = (metric - chance) / (1 - chance) with chance 0 for arith, code, longctx and multiling, 1/12 for intent, 1/2 for safety and pref, and the exact mean of 1/n_options over eligible items for mcq. The baseline's pref metric is 1/2 by definition. The leaderboard aggregate is the weighted mean of the eight normalised scores using the board-adopted suite weights.
Contamination thresholds: arith 0.7000, code 0.6000, intent 0.5500, safety 0.7000, mcq 0.6500, pref 0.6000, longctx 0.6000, multiling 0.6000.
Slice metrics are accuracies of the gated suites over eligible items matching the slice; a slice below min_support items is reported as null.
== Per-source notes
baseline_reference.csv:
* A baseline arithmetic value starting with a minus sign is a negative answer, not a sentinel.
* Baseline code rows give the number of passing samples out of ten in value.
* Baseline multilingual answers are graded under grader g3.
* Baseline scores of exactly 0 or 1 are valid.
* Baseline confidences and scores can carry extra digits; round half-even to the documented precision.
* The baseline's long-context items over its own context window (tokenizer ospsp) score as wrong.
certification_policy.md:
* Scope values compare case-insensitively.
* Held-out is the last exclusion reason: an item that is retired, a duplicate or contaminated keeps that reason even when it is also held out.
* Scope values: in, in_scope and yes mean in scope; held_out, HO and private mean held out.
* A held-out entry with an effective date on or after the window end does not apply.
* A scope of - means the default, in scope.
* Held-out items take no part in slice metrics either.
checkpoint_lineage.json:
* context_window can be written in K units (16K means 16384).
* context_window can be a string of digits.
* tokenizer names the context_lengths.csv column used for the checkpoint: hbpe or ospsp.
code_samples.jsonl:
* A code_samples.jsonl row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
* A code sample passes only when passed equals the problem's test count from the scoring parameters workbook; a total field in the row is the runner's count and can be short.
contamination_hits.jsonl:
* Scans with very low overlap are real scans and keep their item clean.
* Overlaps just below the threshold are clean; they are not rounded up.
* An overlap of null means the scan failed and carries no evidence.
* Overlaps can carry extra digits; round half-even to 4 decimals before comparing with the threshold.
* Training shard names can be upper-cased (SHARD-0042).
* An item is contaminated when any live scan overlap is at or above its suite's threshold in the metric definitions (greater than or equal).
context_lengths.csv:
* The column used for a model is the tokenizer family that checkpoint_lineage.json lists for the model's checkpoint.
* Very long prompts are real.
* A prompt exactly at the model's context window fits; only counts above the window truncate.
control_totals.html:
* expected_rows is the number of results the job produced (items times samples or orderings), including results for ineligible items.
* expected_rows can carry a rows suffix (40 rows).
* value_sum is the sum of the job's primary numeric field (answer, passes, score, confidence) or the count of non-empty answers for text suites.
errata_register.docx:
* EXCLUDE-SHARD entries list training shards whose contamination scans do not count.

eval_store.db:
* Correctness of eval_store.db rows is judged against the gold after upheld grader errata, not the raw gold file.
* A eval_store.db row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
* eval_store.db stores the item as its ordinal position inside the job's shard; the shard map in the metric definitions resolves it.
* Long-context items whose prompt token count for the model's tokenizer exceeds the model's context window score as wrong whatever the answer says.
eval_store_mirror.db:
* eval_store_mirror.db stores the item as its ordinal position inside the job's shard; the shard map in the metric definitions resolves it.
* Long-context items whose prompt token count for the model's tokenizer exceeds the model's context window score as wrong whatever the answer says.
gold_labels.tsv:
* For code problems the gold column holds the problem's test count; a sample passes only when it passes all of them.
* Text gold values can be in decomposed Unicode form; compare in NFC.
* Very large or negative numeric gold values are valid.
* Safety gold is 1 for unsafe and 0 for safe.
* A gold of - marks a suite without a gold answer (preference items).
intent_predictions.csv:
* Correctness of intent_predictions.csv rows is judged against the gold after upheld grader errata, not the raw gold file.
* A intent_predictions.csv row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
item_registry.csv:
* A subtask that looks like a slice domain (law, finance) is still only a subtask; slice domains come from slice_attributes.csv.
job_configs.toml:
* The grader used for a job follows from its harness version.
judge_verdicts.jsonl:
* A judge_verdicts.jsonl row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
legacy_results.txt:
* Correctness of legacy_results.txt rows is judged against the gold after upheld grader errata, not the raw gold file.
* A legacy_results.txt row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
* Answers in legacy_results.txt can carry four decimals; round half-even to two.
prompt_locales.tsv:
* A language enters the multilingual macro average only when it has at least the minimum support of eligible items in the slice definitions.
* The region subtag does not change the language (pt-BR and pt_PT are both pt) and is not the item's slice region, which comes from slice_definitions.yaml.
rerun_results.jsonl:
* Correctness of rerun_results.jsonl rows is judged against the gold after upheld grader errata, not the raw gold file.
* Multilingual rerun answers are compared under the grader of the rerun's harness.
* A multilingual row of rerun_results.jsonl counts toward the macro average only through its item's prompt-locale language, and only when that language meets the minimum support.
* A rerun_results.jsonl row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
* Long-context rerun items over the model's context window score as wrong.
results_fleet_a.log:
* Correctness of results_fleet_a.log rows is judged against the gold after upheld grader errata, not the raw gold file.
* A results_fleet_a.log row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
* Arithmetic answers in results_fleet_a.log can be very large or negative; they are graded as written.
* Numeric values in results_fleet_a.log can carry two digits beyond the documented precision; round half-even to the documented precision before use.
results_fleet_b.log:
* Correctness of results_fleet_b.log rows is judged against the gold after upheld grader errata, not the raw gold file.
* A results_fleet_b.log row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
* Scores of exactly 0 or 1 and confidences of exactly 1 in results_fleet_b.log are valid model outputs and are kept.
* Numeric values in results_fleet_b.log can carry two digits beyond the documented precision; round half-even to the documented precision before use.
results_fleet_c.log:
* Correctness of results_fleet_c.log rows is judged against the gold after upheld grader errata, not the raw gold file.
* Multilingual answers are compared under the grader of the job's harness version; grader g3 also ignores combining accents.
* A multilingual row of results_fleet_c.log counts toward the macro average only through its item's prompt-locale language, and only when that language meets the minimum support.
* A results_fleet_c.log row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
* Free-text answers in results_fleet_c.log can be in decomposed Unicode form; compare in NFC.
* Long-context items whose prompt token count for the model's tokenizer exceeds the model's context window score as wrong whatever the answer says.
run_registry.xml:
* Entries with base="1" number shards from 1; all others from 0.
scores_shard1.parquet:
* Correctness of scores_shard1.parquet rows is judged against the gold after upheld grader errata, not the raw gold file.
* Multilingual answers are compared under the grader of the job's harness version; grader g3 also ignores combining accents.
* A multilingual row of scores_shard1.parquet counts toward the macro average only through its item's prompt-locale language, and only when that language meets the minimum support.

* A scores_shard1.parquet row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
* Text values in scores_shard1.parquet can be in decomposed Unicode form; compare in NFC.
* num values of exactly 0 or 1 in scores_shard1.parquet are valid and kept.
* num in scores_shard1.parquet is a double that can carry digits beyond the documented precision; round the shortest decimal form half-even to the documented precision.

scores_shard2.parquet:
* Correctness of scores_shard2.parquet rows is judged against the gold after upheld grader errata, not the raw gold file.
* A scores_shard2.parquet row whose item is not in the shard of its job (shard map in the metric definitions) is misrouted and ignored.
* num values of exactly 0 or 1 in scores_shard2.parquet are valid and kept.
* num in scores_shard2.parquet is a double that can carry digits beyond the documented precision; round the shortest decimal form half-even to the documented precision.

scores_staging.parquet:
* Correctness of scores_staging.parquet rows is judged against the gold after upheld grader errata, not the raw gold file.
* Multilingual answers are compared under the grader of the job's harness version; grader g3 also ignores combining accents.
* A multilingual row of scores_staging.parquet counts toward the macro average only through its item's prompt-locale language, and only when that language meets the minimum support.
* Text values in scores_staging.parquet can be in decomposed Unicode form; compare in NFC.
* num values of exactly 0 or 1 in scores_staging.parquet are valid and kept.
* num in scores_staging.parquet is a double that can carry digits beyond the documented precision; round the shortest decimal form half-even to the documented precision.

scoring_parameters.xlsx:
* An exact tolerance on an integer gold still compares at two decimals.
* The chance level of the multiple-choice suite is the mean of 1/n_options over eligible items, computed exactly.
* n_options can be written as a letter range (A-D means 4).
* n_options can be written as a word (four, five).
* Text-sheet profile values are informational; grading follows the metric definitions.
* Tolerances are inclusive: |answer - gold| <= 0.01 (abs) or <= 1% of |gold| (rel).
* A parameter of - means the suite has none.
* Test counts can be text with a trailing 'tests'.
* Arithmetic tolerance is written in several forms: exact/eq/==, abs:0.01/absolute 0.01/+-0.01, rel:1%/rel:0.01/relative 1 percent.

slice_definitions.yaml:
* Slice conditions on different attributes are joined by AND; values listed for one attribute are joined by OR.
* A slice metric is reported only when the slice has at least min_support eligible items; below that it is null.
