Baseline scorer card

score = intercept + sum of coefficient x scaled feature (the 6-decimal scaled values) + the offset of the example's canonical merchant (0 when unlisted), rounded half to even to 6 decimals. AUC per split is the Mann-Whitney statistic on these scores with ties counting one half, rounded half to even to 6 decimals.

Footnote: PSI uses the train deciles of each scaled feature (nearest-rank q(0.1) ... q(0.9)) as 9 edges; a value v falls in bin k = number of edges strictly below v. Proportions below 0.0001 are raised to 0.0001. PSI = sum over bins of (a - e) * ln(a / e) with a the oot and e the train proportion, evaluated in decimal arithmetic with 40 significant digits and rounded half to even to 6 decimals.
