== Methodology appendix

Position bias is estimated only over balanced comparisons, those issued in both presentation orders. A bias estimated over all verdicts is not the published figure.

Mixture capping. available_pairs is a source's train pairs, the budget is all train pairs, and a source's cap is epoch_cap times its available pairs. Every source with available pairs starts free and the whole budget is unallocated. Each free source is offered the unallocated budget times its target divided by the sum of the free sources' targets. Every free source offered more than its cap is fixed at its cap and its cap leaves the unallocated budget; the offer is then repeated. When no free source is offered more than its cap, each free source keeps its offer.

allocated_pairs is the whole part of the allocation, effective_weight the allocation divided by the budget, epochs the allocation divided by available_pairs, and capped is true for a source fixed at its cap. A source with no available pairs is allocated 0 and is not capped. The _total entry carries budget_pairs and allocated_pairs, the sum of the sources' allocated_pairs.
