DAYBREAK HOUSEHOLD OPERATIONS MEMO
Routing cycle HB-2034-231 - acquisition profile weekday

SECTION 1 - SCALAR CONTROLS IN FORCE
These values are recorded here and in no other paper. Each is quoted in the unit named beside it and converts under the unit registry.

implausible demand ceiling	12140 mwh
fallback chain depth cap	2 candidates
default max occurrences	4 occurrences
alias hop cap	8 hops

SECTION 2 - READING THE CAP TABLE
Column one is the routine identifier. Column two is the occurrence cap the routine carries in this cycle. A dash records that the routine carries no cap of its own and inherits the resolved policy max_occurrences instead. A cap of zero is an explicit zero and suppresses the routine; it is not an absent field.

SECTION 4 - NOTES
The cap table is the only authority for the routine occurrence cap.
The workbook grids do not carry it and the registers do not carry it.
A cycle that reads the cap from the resolved policy alone will
publish more occurrences than this household authorised.
